## **Genome Annotation Submission Cover Sheet**

## **Preliminary Annotation Review Checklist 5-15-2018**

Phage Name: BadStone

Your Name: Sanghamitra Saha

Your Institution: University of Houston Downtown

Your email: sahas@uhd.edu

Additional emails: sanghasaha@gmail.com

(For correspondence)

Please check each box indicating completion of each task. If you are not sure how to do something, please see the Online Bioinformatics manual page "How to Pass Preliminary Review".

1. Does the genome sequence in your final contain the same number of bases and is it the same as the posted sequence on phagesdb.org?

2. Are all the genes "valid" when you click the "validate" button?

3. Have the genes been renumbered such that they go sequentially from 1 to the highest number?

4. Have all old BLAST hits been cleared, and all gene features reBLASTed?

5. Are the locus tags the "SEA PHAGENAME"?

6. Has the Documentation been recreated to match the information in the feature table?

7. Have tRNA ends been adjusted with web-based Aragorn and/or tRNAscan SE?

8. Has the frameshift in the tail assembly chaperone been annotated (where applicable?)

9. For the items below, generate a genome profile, and review the following. For the

YourPhageName\_CompleteNotes.dnam5 file:

a. Have any duplicate genes (or any with the same stop coordinate?) been removed?

b. Does every gene have **one and only one** complete set of Notes

c. Do the functions in the Notes match the official function list?

d. Are all three lines of functional evidence described for EVERY gene?

e. Do the notes contain the initial Glimmer/GeneMark data from the autoannotation?

For the YourPhageName .dnam5 file:

a. Have any duplicate genes (or any with the same stop coordinate?) been removed?

b. Is the Notes field empty (including hidden marks?)

c. Do the function names in the Product field either match the official function list or say "Hypothetical Protein"?

d. Is the Function field empty (including hidden marks?)

✓ 10. Did you use PECAAN to annotate your phage?

If, so please describe how in the text field after question 11.

11. Describe any issues or specific genes that you were unable to satisfactorily resolve, and warrant further inspection in the Quality Control review.

PECAAN was used to verify student work and add features that were missed. The PECAAN export file was edited in a text editor using "find and replace" to enter BLAST-Start field and the CompleteNotes file was parsed using the edited export file.

All starts were verified by comparison with starterator and comparison with phamerator

Notes of interesting annotations and justification of calls have been added to the end of some notes in the complete file

Genes 13-16 are head to tail adaptor/connector, which did not correspond to other members
