

**Transmission electron micrograph of phage Safar.** Measurements from three individual virions show a capsid  $67.3 \pm 0.6$  nm long and  $64.9 \pm 0.3$  nm wide, and a tail  $219.9 \pm 1.3$  nm long, consistent with a siphovirus morphotype. Particles were negatively stained with 1% uranyl acetate and imaged at 120 kV. Scale bar = 80 nm.
