

Isolation site and plaques of Soypalloi phage. (left) Soypalloi was isolated from soil collected from a field of conventionally grown soybeans adjacent to FieldTrip farm in Ottawa, ON. (right) Direct isolation plate using *Arthobacter globiformis* B-2979 as a host yielded two plaque morphologies, clear and turbid. Soypalloi produced turbid plaques that were purified, amplified and archived. Soytoy produced clear plaques (see the Soytoy phagesdb entry).
